ABOUT

Final-semester Systems Analysis and Development student at FIAP, focused on the Java/Spring Boot ecosystem. Rather than listing isolated technologies, I prefer to show the reasoning behind each project: what real problem it solves and why the solution was built the way it was. Looking for my first position as a junior or trainee back-end developer.

SKILLS

Java

Spring Boot

Spring Security

Spring Data JPA

PostgreSQL

JPA/Hibernate

Flyway

Docker

RESTful APIs

Layered architecture

Git/GitHub

SQL

JUnit

Quarkus

Currently learning:

AWS

RabbitMQ

MongoDB

PROFESSIONAL EXPERIENCE

ClyvoCare • FIAP Challenge

2026 • Present

Java • Spring Boot • Oracle • Flyway • Spring Security (JWT/RSA) • Docker • Azure • github.com/ClyvoPet-Challenge-2026/Java-Sprint-1

Context: pet health-plan system for Clyvo, a real company that sponsored the challenge. Two APIs (Java and C#.NET) sharing one Oracle database, under a data contract defined by the team.

Problem: an already-populated database and two APIs that needed a single, secure authentication layer.

Solution: Flyway migration with a baseline over the existing database; JWT authentication signed with an RSA key pair and role-based authorization (ADMIN/OWNER) on every route; Docker deployment on Azure with automated provisioning.

PROJECTS

Farmalog

2026 • Personal project • in progress

Java 21 • Spring Boot • Spring Data JPA • PostgreSQL • Flyway • Docker • JUnit • github.com/ggabmartins/farmalog-api

Context: independent pharmacies track stock expiration dates in spreadsheets.

Problem: expired products get sold, and older batches are forgotten while newer ones sell first.

Solution: REST API with batch-level stock and FEFO consumption, Flyway-versioned schema, DTOs and ProblemDetail errors (RFC 7807). In progress: JWT and role-based authorization.

FlowHome • FIAP Global Solution

2025 • Team project

Java • Quarkus • REST API • React • TypeScript • github.com/ggabmartins/flowhome-gs

Context: hybrid teams with no single view of tasks and productivity.

Problem: scattered information, no aggregated dashboard.

Solution: Quarkus REST API with the dashboard aggregation endpoints, integrated with the team's React front-end.

EDUCATION

Systems Analysis and Development • FIAP • São Paulo, SP • Feb/2025 – Dec/2026
