ABOUT

Final-semester Systems Analysis and Development student at FIAP, focused on the Java/Spring Boot ecosystem. Rather than listing isolated technologies, I prefer to show the reasoning behind each project: what real problem it solves and why the solution was built the way it was. Looking for my first position as a junior or trainee back-end developer.

PROFESSIONAL EXPERIENCE

ClyvoCare – FIAP Challenge

2026 · Team project

Java · Spring Boot · Oracle · Flyway · Spring Security (JWT/RSA) · Docker · Azure – github.com/ClyvoPet-Challenge-2026

Context: team of 5 building a pet health-plan system for Clyvo, a real company that sponsored the challenge, split into two APIs (Java and C#.NET) sharing the same Oracle database, under a data contract agreed on as a team before coding.

Problem: the Oracle database was already populated when I joined the project, and both APIs needed a single, secure authentication layer shared across teams.

Solution: I implemented the schema migration to Flyway with a baseline over the already-populated database, and the authentication core – JWT signed with an RSA key pair, password hashing, and role-based authorization (ADMIN/OWNER) on every route – plus the Docker deployment on Azure with an automated provisioning script.

PROJECTS

Farmalog

2026 · Personal project

Java 21 · Spring Boot · Spring Data JPA · PostgreSQL · Flyway · Docker · JUnit – github.com/ggabmartins/farmalog-api

Context: independent pharmacies manage expiration-sensitive stock in spreadsheets, where two boxes of the same medicine can have different expiration dates.

Problem: spreadsheet-based control causes two recurring losses – expired stock being sold, and older batches sitting forgotten while a newer one sells first.

Solution: REST API that tracks stock by batch (not by product), with automatic FEFO-based consumption, a Flyway-versioned schema, DTOs decoupled from the entity, and centralized error handling in ProblemDetail format (RFC 7807). In progress: JWT authentication and role-based authorization.

FlowHome – FIAP Global Solution

2025 · Team project

Java · Quarkus · REST API · React · TypeScript – github.com/ggabmartins/flowhome-gs

Context: hybrid teams with no simple way to organize tasks by category and track team productivity.

Problem: productivity data scattered across tools, with no single dashboard aggregating the team's progress.

Solution: I built the REST API in Java Quarkus, including the aggregation endpoints that feed the productivity dashboard, fully integrated with the team's React/TypeScript front-end.

SKILLS

Java · Spring Boot · Spring Security · Spring Data JPA · PostgreSQL · JPA/Hibernate · Flyway · Docker · Docker Compose · RESTful APIs · Layered architecture · Git/GitHub · SQL · JUnit · Quarkus
Currently learning: AWS, RabbitMQ, MongoDB

EDUCATION

Systems Analysis and Development – FIAP · São Paulo, SP · 4th semester (final) · Feb/2025 – Dec/2026
